Let this rod be turned by an angle  $j$  about an axis at right angles to AXA2. In the new position the forces  $F_v$   $F_2$ , instead of being in equilibrium, form a couple whose moment is  $F_X$  AXA2  $\sin f$ . If in the original position of the rod the forces tend to increase the distance AXA (Fig. 42), the couple in the new position will 2. STABILITY. tend to bring the rod back to its position of equilibrium. In this case the original position of the rod is said to be a position of stable equilibrium. The effect of the earth's magnetism on the needle of a compass offers a familiar example. If, however, in the original position the forces tend to diminish the distance AXA2 (Fig. 43), the couple arising after displacement tends to increase the displacement and thus to remove the rod still farther from equilibrium. The original position in this case is said to be one of unstable equilibrium. The weight resting on a vertical post and the reaction of the support on which the rod stands may be taken as an illustration. Finally, a third case would arise if the forces  $F_v$   $F_2$ , being still equal and opposite, were applied at one and the same point of the rod. The forces would then remain in equilibrium after any displacement of the rod; such equilibrium is called neutral or astatic. 154. These different cases of equilibrium can be distinguished by the...
