Brand New Book ***** Print on Demand *****.Excerpt from *The Alternating Current Commutator Motor, and the Leakage of Induction Motors* When, some years ago, the single-phase motor with commutator made its appearance in the technical world, and its practical importance had been proved by successful designs, the attention of inventors was directed to this class of machines. A great many new types were introduced in all parts of the world, so that it was impossible for the average electrical man to follow and to distinguish between improvement and new principle. Classification may, therefore, help to clear matters. One way of effecting this classification is to express every feature of the machines by their names. Another method, which has been preferred in this book, is to show that there are actually only two different principles: - 1. Direct current machines, made suitable for alternating current by laminating the field, inserting resistance between the armature and commutator, by compensating armature reaction, and by providing commutating poles wound in a special way. 2. Repulsion motors (I retain this name, which appears to be very popular, in spite of the fact that the word repulsion is not strictly correct).
